**NRG**  
ONCOLOGY

*Advancing Research. Improving Lives.™*

# Credentialing Requirements (SECTION 5)

# Benchmark Planning

- Planning tool by which to familiarize each institution with the specific planning goals of the protocol
- *Pre-enrollment* review versus *pre-treatment* review

# NRG BR001: IROC Phantoms

- Institutions need to credential for only the most complex modality they intend to use! (3D → IMRT → VMAT)
- The following techniques must be included in credentialing prior to use in patients enrolled onto BR001:
  - Motion management technique
  - FFF beams
- Techniques may be combined
  - Ex: IMRT using FFF delivered with motion management

# NRG BR001: IROC SBRT Phantoms

Lung

Lung & Spine Irradiation

## NRG BR001 Requirements

This trial will utilize TRIAD for dosimetry digital treatment data submission. TRIAD is the American College of Radiology's (ACR) image exchange application and it is used by the NRG. See [here](#) for information on installing TRIAD.

In order to complete the **SBRT credentialing** process, the following items must be completed:

- All participants are asked to complete the [Facility Questionnaire](#).
- All participants are asked to complete and submit a [Specific Benchmark Plan](#). Click [here](#) for the DICOM structure file for CyberKnife.
- Successfully complete the IGRT credentialing study. Details can be found [here](#). (Click [here](#) for IGRT data spreadsheet).
- Irradiate the IROC Houston's SBRT phantom. Please fill in the [request form](#) online.
- Pre-Treatment Review is needed. See section 6.0 of protocol for details.

Note:

- Institutions that were previously credentialed to participate in another SBRT protocol or have a question about your status for this protocol, please fill out the [credentialing status inquiry](#) form.
- [Click here to access the DVA being used to evaluate all BR001 patients.](#)
- [Frequently Asked Questions](#)

# NRG BR001: FAQ

- Can my institution plan the benchmark with a single isocenter even though my institution has not yet credentialed to deliver treatment to 2 metastases using a single isocenter?
  - *Yes*
- What should I do if an OAR is not in the structure set?
  - *Contour it if you would like to use it for planning*
- What QA measurements are required?
  - *None*
- Should the benchmark plan be reviewed by our physician?
  - *Absolutely! To ensure it's clinically acceptable*

# NRG BR001: FAQ

- If the plan is intended to treat both lesions simultaneously on the same day, am I required to submit separate dose grids for each lesion?
  - *No (e.g., single VMAT plan)*
- For an IMRT/VMAT plan, is a normalization of 60-90% required?
  - *No, but ensure conformality is high*
- How should the conformality of the plan be assessed?
  - *See Table 6-4*
  - *80% isodose should break up between 2 lesions*

# NRG BR001: FAQ

- I cannot meet the PTV coverage requirements while also meeting all the OAR constraints in Table 6-6. How should these competing constraints be balanced?
  - *BR001 provides guidance on the “planning priorities” (SECTION 6.4.5):*
    1. *Spinal dose constraints, as assessed on the composite dose map, must always be met.*
    2. *PTV coverage may not fall below 70% of the 45 Gy prescription dose in regions overlapping with OAR.*
    3. *No dose >47.25Gy may exist outside PTV. In addition, no dose >47.25Gy may exist in PTV volumes that overlap directly with OAR (e.g., Liver, Kidney\_L, Stomach, Bowel). See SECTIONS 6.4.3 & 6.5.4.*
  - *It is left to the discretion of the institution as to whether they will prioritize PTV coverage over OAR (e.g., stomach) constraints.*

# NRG BR001: Benchmark Evaluation

- How will the benchmark be evaluated?
  - Dose Volume Analysis (DVA) will be used to tabulate data
  - Composite dose will be used to evaluate all OAR constraints including 105% hotspot location
  - If each metastasis is planned for treatment on separate days, individual dose maps will be evaluated for PTV coverage

# NRG BR001: Dose Volume Analysis (DVA) for Benchmark Evaluation

## NRG-BR001 QA Review Dose-Volume Analysis

Record case specific parameters in blanks (light yellow) below

Site ID# :  Site Name:   
 Case # :  Technique:   
 Rx Dose ( 45 Gy)  Gy  
 # of Fractions (3 )

**NOTE: if OAR receive dose from metastatic sites treated with both 3 and 5 fractions, use 3 fraction OAR constraints**

### Normal Structure Constraints and Compliance Criteria For 3 Fractions

Name of Structure		Dosimetric parameter	(1) Per Protocol	(2) Variation Acceptable	(3) Deviation Unacceptable	Value	Score
SpinalCord	Spinal Cord	D0.03 cc (Gy)	<=22.5 Gy		>22.5 Gy		
SpinalCord	Spinal Cord	D1.2 cc (Gy)	<=13 Gy		>13.0 Gy		

## NRG-BR001 QA Review Dose-Volume Analysis

Record case specific parameters in blanks (light yellow) below

Site ID# :  Site Name:   
 Case # :  Technique:  Abdominal  
 Rx Dose (45 Gy)  45 Gy  
 # of Fractions (3 )  3  
 70%Rx 31.5 Gy

### Target Volume Constraints and Compliance Criteria

GreatVessels	Great vessels (non Adjacent wall)	I
GreatVessels	Great vessels (non Adjacent wall)	I
Trachea	Trachea(non Adjacent wall)	I
Trachea	Trachea(non Adjacent wall)	I
Stomach	Stomach	I
Stomach	Stomach	I
Duodenum	Duodenum	I
Duodenum	Duodenum	I

Name of Structure	Description	Dosimetric parameter*	(1) Per Protocol	(2) Variation Acceptable	(3) Deviation Unacceptable	Value	Score
PTV_4500_7a	3 Fractions	D95%	45.0 Gy	42.5 Gy to 45.5 Gy	<42.5 Gy or ≥ 45.5 Gy	45.43	
PTV_4500_7a	3 Fractions	V70%Rx(%)		99.5		100	1

# NRG BR001: IGRT Credentialing

## IGRT Credentialing Submission Requirements

### 2D IGRT

1. Brief description of registration technique used in submitted data. Include type of IGRT technology, method of motion management, registration surrogate, correction threshold, and any use of verification imaging.
2. Spreadsheet describing shifts performed.
3. Image files of screen captures displaying the registration from two consecutive treatment fractions.

### 3D IGRT

1. Brief description of registration technique used in submitted data. Include type of IGRT technology, method of motion management, registration surrogate, correction threshold, and any use of verification imaging.
2. Spreadsheet describing shifts performed
3. DICOM export of the treatment plan data
4. DICOM export of data from two consecutive treatment fractions is required.

# NRG BR001: IGRT Credentialing

- Purpose:
  - To assess whether positioning with image-guidance will ensure accurate PTV coverage
- How is this accomplished?
  - Assess description of IGRT workflow including threshold for correction of translations & rotations
  - Assess image quality (technique, FOV)
  - Assess final treatment position relative to PTV margin required for protocol

Received Oct 25, 2011, and in revised form Feb 28, 2012. Accepted for publication Mar 2, 2012

- Potential issues encountered with 3D registration:
  - Table movement prior to acquiring CBCT
  - Inter-observer variation

# NRG BR001: IGRT Credentialing

- Recommended data for 2D IGRT:
  - 2D screenshots in addition to 2D DICOM images:
    - Reticule or scale
    - PTV contours
    - OAR contours (e.g., lung, spine)
  - 2D OBI screenshots at final treatment position helpful
- Recommended data for 3D IGRT:
  - Screenshots of in-house registration between CBCT & planning CT
    - Reticule or scale
    - 3D blending/subtraction

\* Please provide any information of the registration process that can help to assess the registration results (e.g., if the registration is a fully automatic result from the software; if any specific structure is used for alignment; if any specific ROI is used during registration; if any manual adjustment is involved; etc. Please provide another sheet if the space in this form is not enough.)

Registration for spine is performed with automatic registration to an ROI defined manually to match the PTV (i.e., vertebral bodies)

Our workflow is the following: 1) position the patient to external alignment marks 2) acquire kV orthogonal images with ExacTrac

3) auto-register PTV 4) review then apply shifts including rotations using 6-degree couch 5) obtain orthogonal kV with ExacTrac to verify

residual shifts are less than half of the PTV margin & less than 1 degree 6) obtain verification orthogonal kV images using Varian OBI

7) auto-register PTV to confirm shifts are less than half of the PTV margin & less than 1 degree

Tolerance for shifting is set to 1/2 of PTV margin; for 3mm margin tolerance is 1.5mm and for 2mm margin tolerance is 1mm
